

RESPONSIBLE NURSE APPROACH TOWARDS PATIENTS

The question that raises the interest and has led us to choose our topic of the final work is what means "accountability", which today so many (no) speaks / shifts / transfers to another? In general, we can argue that "we observe relatively modest knowledge and understanding of this concept in a value and ethical sense", primarily in building the professional autonomy of sisterhood. Responsibility is defined as a virtue by which we conscientiously and responsibly perform our duty. But we wonder what it all implies under a professional and humanistic view of the implementation of ethics of care? Numerous professional codes suggest that a nurse is a person who, in his daily professional vocation to health care, has the task to responsibly and successfully perform his / her work, especially if he / she is able to develop trust-based partnerships and establish open and high-quality communication with the patient. It also emphasizes that the ability of a nurse to feel internal responsibility is a key element of success in providing healthcare to the patient. To the extent of this achievement, a nurse / technician can be described as a professional who responsibly represents and advocates the interests of patients, responsibly applies their knowledge and skills in order to achieve his / her well-being. "The nurses are the ones who spend most of their time with the patients and who, as persons (rather than diagnoses), regularly know many, incomparably more than the doctors who heal them, and the skills, empathy, sensitivity and nursing care often depends on the overall outcome of the treatment. "The nurses / technicians are expected to be trained to perform nursing practice skills, to provide quality patient care, to always be available when needed, to provide patient privacy, to be skilled and quick in their work, to accept differences among individuals,

to look at the individual in general, to have a convenient and understandable dictionary, to listen to and trust the patient, and to teach him the techniques and methods of improving his / her own health. The way in which we approach our neighbor, to face the sickness, suffering and death, is closely related to our perception of man, his source, his dignity and the meaning of life. In that sense, being a health professional is not primarily a matter of career, practicing crafts, performing a function. This profession primarily means a relationship that depends on the issues: for whom do I work - for a good patient, medicine or institution, how to tell the truth, without pain, how to establish dialogue and collaborate with associates? Do I feel professional and responsible? Do we face some professionally constrained difficulties, such as bureaucracy, work ops, administrative overheads, overtime, overcrowding, drug constraints and impaired equipment standards? A responsible nurse is meeting the many challenges and imperatives that we will try to point out in this final work on the path of his professional achievement. Today, more and more complex requests for solving and solving patient problems are involved, including competence, knowledge, ethical approach, experience, skill, responsibility, competence, and motivation to the nurse. Some nursing practices require certain courage, verbal strength and tact, especially when nursing thinking for the benefit of a patient differs from a doctor. In order for the sister to answer all the challenges of contemporary nursing care responsibly, of course, apart from the existing education in the field of vocational high school and polytechnic education, he must have adequate academic and scientific training and sufficient research scientists who would be a development pledge on their own scientific and research potentials. The nurse accepts the responsibility and obligation for her own procedures and the results of providing nursing care within the legal frameworks of nursing practice, is continuously upgraded to the offered lifelong learning programs and accepts the assigned duties related to the patient belonging to her competences and
